EC2 환경 세팅 및 배포 명령어 정리

EC2 환경 세팅 및 배포 명령어 정리

- 1. EC2 환경에서 모든 배포 환경을 Docker로 진행하였기 때문에 Docker와 Docker-compose를 설치한다.
 - ▼ Docker, Docker-compose 설치명령어

```
# 설치하기 전 기존에 설치된 Docker를 삭제
sudo apt-get remove docker docker-engine docker.io containerd runc
sudo apt-get update
# Docker 레포지토리 설정을 하기 위한 패키지 설치
                                                                                                            curl gnupg
                                                                                                                                                             lsb-release
sudo apt-get install
                                                             ca-certificates
# Docker의 GPG 인증서를 가져와 로컬에 저장
\verb|curl -fsSL | https://download.docker.com/linux/ubuntu/gpg | sudo | gpg --dearmor -o /usr/share/keyrings/docker-archive-keyring.gpg | line | gpg --dearmor -o /usr/share/keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive-keyrings/docker-archive
(lsb\_release - cs) stable" | sudo tee /etc/apt/sources.list.d/docker.list > /dev/null
sudo apt-get update
# Docker CE버전 설치
sudo apt-get install docker-ce docker-ce-cli containerd.io
# 도커 버전 확인
docker --version
# 리눅스 user 에 docker 권한 설정
sudo usermod -aG docker $USER
# docker compose 다운로드 요청
sudo curl -L "https://github.com/docker/compose/releases/download/1.29.2/docker-compose-$(uname -m)" -o /usr/loca
# 다운로드 받은 docker compose에 쓰기 권한 추가
sudo chmod +x /usr/local/bin/docker-compose
# 버전확인
docker-compose --version
# 재부팅
sudo reboot
# 도커 모든 컨테이너 확인
docker ps -a
```

▼ Docker network 구축

```
# Docker network 생성
ubuntu@ip-172-26-12-167:-$ docker network create test-network

# Docker network 목록 확인
ubuntu@ip-172-26-12-167:-$ docker network ls
NETWORK ID NAME DRIVER SCOPE
305a3c86c589 bridge bridge local
29ca0cfe31ec host host local
3bcd29cbb288 none null local
dd223112dce0 redis-network bridge local
570bd786e601 test-network bridge local
```

- 2. 아래 필수 컨테이너들을 구축한다.
 - ▼ Jenkins 컨테이너 구축 및 접속 명령어
 - 1. Docker Volume 생성 및 컨테이너 구축

```
# 경로에 jenkins 폴더 생성 - 추후에 Volume으로 만들기
mkdir -p /home/ubuntu/jenkins
# 도커 컨테이너 실행. -v 옵션을 통해 도커 외부와 컨테이너 내부를 연결시켜준다.
docker run --name jenkins-container -d -p 8888:8080 -p 50000:50000 -v /home/ubuntu/jenkins:/var/jenkins_home -v /var/run/dock
```

```
# 도커 컨테이너 실행
docker start jenkins-container

# 도커 컨테이너 내부 접속
docker exec -it jenkins-container /bin/bash
```

- 2. EC2 도메인:포트 로 접속
 - http://i8b310.p.ssafy.io:8888/
- 3. 플러그인 설치
- ▼ MySQL 컨테이너 구축 및 설정
 - 1. MySQL 8.0 이미지를 통한 컨테이너 구축

```
docker run --name mysql-container
--network test-network -d -p 3306:3306
-e MYSQL_ROOT_PASSWORD=qwer1234 mysql:latest
```

2. MySQL 접속 및 USER 권한 생성

```
# MySQL 컨테이너 접속
docker exec -it mysql-container bash
# MySQL 서버 접속
mysql -u root -p
```

3. 사용자 목록을 검색

4. 유저 생성 및 권한 부여

```
create user ssafy
# moonrise 데이터베이스의 모든 테이블에 모든 권한을 줌
grant all privileges on moonrise.* to 'ssafy'@'localhost';
```

5. 변경사항 즉시 반영

```
flush privileges;
```

- ▼ NGINX 컨테이너 구축 및 설정 파일
 - 1. ~/nginx/default.conf 파일 생성

```
mkdir ~/nginx
vi ~/nginx/default.conf
```

▼ default.conf 설정 파일

```
upstream BackEnd {
       #server pjt1-container:9001;
       server 172.17.0.1:9001;
upstream Auth {
       server pjt2-container:9002;
upstream Chat {
       server pjt3-container:9003;
server {
   listen
                 80;
    server_name localhost;
   #server_name i8b310.p.ssafy.io;
   underscores_in_headers on; # 1. 언더형식의 헤더를 허용한다.
    location / {
       root /usr/share/nginx/html/build;
index index.html index.htm;
      try_files $uri $uri/ /index.html;
    location /api {
       proxy_pass http://BackEnd;
    location /auth {
       proxy_pass_request_headers on; # 2. 요청된 헤더를 프록시하는 서버로 전달
       proxy_set_header X-Real-IP $remote_addr;
proxy_set_header X-Forwarder-For $proxy_add_x_forwarded_for;
       proxy_set_header Host $http_host;
       proxy_pass http://Auth;
    location /chat {
       proxy_pass http://Chat;
       proxy_set_header Upgrade $http_upgrade;
proxy_set_header Connection "upgrade";
       proxy_http_version 1.1;
       # add_header 'Access-Control-Allow-Origin' '*';
       # 리다이렉트 non-https 를 https
       # if($scheme != "https"){
       # return 301 https://$host$request_uri;
# }
    #error_page 404
                                   /404.html;
    \ensuremath{\text{\#}}\xspace redirect server error pages to the static page /50x.html
    error_page 500 502 503 504 /50x.html;
    location = /50x.html {
       root /usr/share/nginx/html;
```

2. Docker 컨테이너 구축 및 설정 파일 매핑

```
docker run
   --name nginx-container
   --network test-network
   -d -p 80:80
   -v ~/nginx/default.conf:/etc/nginx/conf.d/default.conf
   nginx:latest
```

▼ Redis 컨테이너 구축 및 설정 파일

Docker image

- bitnami/redis:latest 사용
- ▼ HA(고가용성)을 위해 서버를 아래와 같이 구성
 - Redis-master (6379)
 - Redis-slave1 (6380)
 - Redis-slave2 (6381)

- Redis-sentinel (23679)
- Redis-sentinel (23680)
- · Redis-sentinel (23681)
- 1. docker-compose.yml 파일 작성
 - ▼ docker-compose.yml

```
version: '3'
    redis:
        image: 'bitnami/redis:latest'
        container_name: redis-master
        environment:

    REDIS_REPLICATION_MODE=master
    ALLOW_EMPTY_PASSWORD=yes

        networks:
          - test-network
        ports:
          - 6379:6379
    redis_slave-1:
        image: 'bitnami/redis:latest'
        container_name: redis-slaves-1
        environment:
          - REDIS REPLICATION MODE=slave
          - REDIS MASTER HOST=redis
          - ALLOW_EMPTY_PASSWORD=yes
        ports:
           - 6479:6379
        depends_on:
           - redis
        networks:
          - test-network
    redis_slave-2:
        image: 'bitnami/redis:latest'
        container_name: redis-slaves-2
        environment:
          - REDIS REPLICATION MODE=slave
          - REDIS MASTER HOST=redis
          - ALLOW_EMPTY_PASSWORD=yes
        ports:
           - 6579:6379
        depends_on:
          - redis
        networks:
          - test-network
    redis-sentinel-1:
       image: 'bitnami/redis-sentinel:latest'
        container_name: redis-sentinel-1
        \hbox{\it environment:}
            - REDIS_SENTINEL_DOWN_AFTER_MILLISECONDS=3000
            - REDIS MASTER HOST=redis
            - REDIS_MASTER_PORT_NUMBER=6379
            - REDIS_MASTER_SET=mymaster
            - REDIS_SENTINEL_QUORUM=2
        {\tt depends\_on:}
            - redis
            - redis_slave-1
            - redis_slave-2
        ports:
- '26379:26379'
        networks:
            - test-network
    redis-sentinel-2:
        image: 'bitnami/redis-sentinel:latest'
        container_name: redis-sentinel-2
        environment:
           - REDIS_SENTINEL_DOWN_AFTER_MILLISECONDS=3000
            - REDIS_MASTER_HOST=redis
            - REDIS_MASTER_PORT_NUMBER=6379
            - REDIS MASTER SET=mymaster
            - REDIS SENTINEL QUORUM=2
        depends_on:
            - redis
            - redis_slave-1
            - redis_slave-2
        ports:
- '26380:26379'
        networks:
```

2. docker-compose 로 컨테이너 구축

```
# Docker compose up 컨테이너 실행
docker-compose up -d
# Docker 컨테이너 모두 내리고 삭제
docker-compose down
```

3. 구축한 컨테이너 목록 확인

ubuntu@ip-172-26-12-167:~\$ docker ps -a
